

Vibranium Veiled: Rebuilding Wakanda

Thomas Jefferson Model United Nations Conference

Middle School Crisis Committee

Co-Chairs: Anish Kulkarni & Sarvajith Mahendra

Committee Director: Pranav Kethireddy

Thomas Jefferson High School for Science and Technology

March 13-14, 2026

Committee Information:

Wakanda has been thriving off of Vibranium for decades now. However, other countries are catching up to Wakanda's technological innovation. Therefore, the Wakandans, harvesting the energy from the Mind Stone shards from when Thanos killed Vision, created an alloy made from vibranum and Mind Stone Dust: Void Steel. This alloy can store immense amounts of energy, and when implemented correctly, can activate the X-gene in humans, thus turning them into mutant beings. Von Stricker accomplished this feat with Wanda Maximoff, giving her powers far beyond the ordinary. The abilities of the mutants vary based on their personality, which provides unpredictability and extreme danger.

Void Steel is also an extremely powerful fuel, being reusable, but the fumes emitted from using Void Steel are cancerous and flammable, thus presenting an incredible risk if not accounted for correctly. Luckily, Void Steel is still in the growth phase for now, and it is nigh-impossible to steal. Another issue that the state of Wakanda faces is the influx of black market trades. Nobles are being tortured for information on vibranium deposits, and due to this, Wakanda's government is dropping like flies, and vibranium deposits are being stolen. From this, a black market has been ensuing, led by the organization, OKONKWO. The leader is unknown, and although some of the peon members are caught selling Vibranium, they do not know anything useful about OKONKWO, like their leaders or the whereabouts of trade sites. OKONKWO is especially dangerous as they have knowledge of Void Steel, and if they acquire it, the consequences could spell doom for the entirety of Wakanda.

Topic A: Regulation and Innovation of Void Steel:

Background:

As Wakanda faces more global competition and internal problems, its scientists have discovered a groundbreaking new material: Void Steel. This alloy is made by combining vibranium with leftover Mind Stone dust collected after Vision's destruction. Void Steel can store and release a huge amount of energy, even exceeding vibranium in how it can be used. When managed correctly, it can power entire cities, strengthen Wakanda's defenses, and speed up rebuilding efforts. However, Void Steel brings serious dangers. Exposure to its energy can awaken the dormant X-gene in humans, turning them into mutants with powers that depend on their personality and mental state. While this process could create strong defenders for Wakanda, it also leads to unpredictability, inequality, and the potential for disastrous misuse.

The actions of Baron von Strucker with Wanda Maximoff highlight both the great power and ethical issues tied to forced or uncontrolled activation. Moreover, Void Steel acts as an efficient, reusable fuel source, but its use releases toxic, flammable fumes that can cause cancer if not managed properly. A single mistake in regulation, storage, or transport could lead to mass casualties or severe environmental harm. Although Void Steel is hard to steal and still being developed, intelligence reports suggest that the black-market group OKONKWO knows about it. If Void Steel were to leak, be weaponized, or be copied, the fallout could go far beyond Wakanda, endangering global security and shifting the balance of power. Wakanda must face a crucial challenge: how to keep innovating with Void Steel to protect its sovereignty and technological advantage while ensuring strong ethical standards, public safety, and defense against both internal corruption and outside exploitation.

Questions to Consider:

- Should Wakanda continue developing Void Steel, or should it pause until the long-term effects are fully understood?
- Who should control the regulations for Void Steel: Wakanda's monarchy, a scientific council, an international organization, or a mix of these?
- Should activating the X-gene using Void Steel ever be allowed, and if so, what ethical guidelines and consent requirements should be in place?
- How can Wakanda safely use Void Steel as a fuel source while reducing risks to the environment and public health?
- What protections should be established to stop Void Steel from getting into the hands of groups like OKONKWO?
- Should Void Steel stay a secret in Wakanda, or should some information be shared globally to prevent fear, spying, or arms races?

Topic B: Addressing Black-Wakandas Vibranium Trade:

Background:

Vibranium is the world's strongest metal and a cornerstone of Wakanda's technological supremacy, economic stability, and security. For centuries, Wakanda was able to safeguard this precious resource through strict isolation; however, as it has opened itself to the global community, it brings the challenge of the rapid expansion of black-market vibranium trade. Black-market vibranium trade refers to the illegal buying, selling, or smuggling of vibranium outside of Wakanda's control. Illicit vibranium trafficking threatens not only Wakanda's sovereignty but also global stability. In the wrong hands, vibranium can be weaponized, destabilize governments, empower criminal networks, and fuel international conflict. The black market trade is extremely dangerous, and it is all facilitated by a black-ops organization: "Okonkwo".

One of the most pressing reasons why black-market trade is occurring is due to corruption and betrayal amongst the people of Wakanda. Many people who seem trustworthy currently hold the power to obtain and sell vibranium illegally to outside nations and entities in return for wealth, information, and power. Many times, these people hold political power in Wakanda and have vast spy networks and loyal enforcers working under them.

It is up to all members in this world to find out which people are running "Okonkwo" and whether there are any traitors in this committee. Many task forces are already being sent by Wakandan leaders such as Shuri and Ramonda to address this issue but much more needs to be

done. Additionally, it is necessary to improve public relations with outside nations while still safeguarding vibranium.

Questions to Consider:

1. How can Wakanda effectively prevent vibranium from entering the black market without harming trade or diplomacy?
2. Should Wakanda share limited vibranium technology to reduce black-market incentives, or restrict access further?
3. What international frameworks or cooperation mechanisms could regulate vibranium trade?
4. What penalties or consequences should exist for states, corporations, or organizations caught trafficking vibranium?

1. Shuri

Shuri is Wakanda's leading scientific authority and the mind behind most vibranium-based technology. When operating in vibranium-rich environments, she can rapidly design, counter, or override advanced systems, creating weapons, shields, and neural tech in real time. Without access to vibranium infrastructure, her intelligence remains extraordinary but drops to elite human levels. Her greatest limitation is political: the High Council tightly controls her access to raw vibranium.

2. Killmonger (Erik Stevens / N'Jadaka)

Killmonger is a Wakandan exile shaped by global warfare and ritual enhancement. He possesses increased strength, endurance, reflexes, and pain tolerance, paired with elite tactical training. He excels at locating hidden or unguarded vibranium reserves using both Wakandan knowledge and foreign intelligence. His weakness is psychological—his obsession with control makes long-term alliances unstable.

3. Okoye

Okoye is the General of the Dora Milaje and Wakanda's most disciplined warrior. Mastered in all Wakandan combat styles, she wields a vibranium spear capable of piercing armor, disrupting energy fields, and releasing shockwaves. Her power comes from precision and leadership rather than enhancement. She will not act if it violates Wakandan law or risks national stability.

4. Nakia

Nakia is a War Dog operative specializing in espionage and sabotage. Her vibranium-weave suit absorbs kinetic energy, suppresses sound, and allows limited cloaking. She is highly effective at dismantling illegal vibranium trade routes outside Wakanda. Her independence often puts her at odds with authority, risking exile or imprisonment.

5. M'Baku

M'Baku is the leader of the Jabari Tribe and Wakanda's strongest unenhanced warrior. His raw strength and endurance allow him to overpower vibranium-armed foes through sheer force. The Jabari reject vibranium technology, making him immune to tech-based interference but vulnerable to energy weapons. He acts only to protect his people.

6. Ramonda

Queen Ramonda is Wakanda's political anchor and cultural historian. She possesses extensive knowledge of ancient vibranium sites erased from modern records. Though not a combatant, her authority and strategic insight guide the hunt. Her vulnerability lies in reliance on others for protection.

7. W'Kabi

W'Kabi is the former leader of the Border Tribe and an advocate for militarizing vibranium. He commands advanced vehicles and sonic defenses powered by vibranium. His rigid belief in strength through force makes him effective but dangerous, as he prioritizes security over morality.

8. Ayo

Ayo is a Dora Milaje captain tasked with guarding restricted vibranium zones. She specializes in rapid-response combat and coordinated defense tactics. While efficient and loyal, she struggles in morally ambiguous situations involving exploitation of vibranium.

9. Aneka

Aneka is a former Dora Milaje who rejects Wakanda's justice system. Using Midnight Angel armor, she gains flight, enhanced strength, and energy weapons. She seeks vibranium to dismantle institutions she views as corrupt. Her emotional bias often overrides long-term strategy.

10. Hunter (White Wolf)

Hunter is Wakanda's former intelligence chief with knowledge of secret vibranium vaults and black-ops facilities. He excels in covert warfare, surveillance, and psychological manipulation. His distrust of authority and emotional detachment isolate him from allies.

11. Ulysses Klaue

Klaue is an international arms dealer obsessed with vibranium. His sonic arm weapon can destabilize vibranium structures and disable Wakandan tech. Though physically weaker, his unpredictability and greed-driven ingenuity make him extremely dangerous.

12. Zuri

Zuri is a spiritual elder who understands the ceremonial and mystical traditions surrounding vibranium. He provides insight into rituals and ancient safeguards unknown to scientists. His age and pacifism prevent direct involvement in combat. He has the ability of Immortality, which allows him to drastically increase his lifespan, and allows him to reincarnate when he dies.

13. T'Chaka

T'Chaka's influence persists through teachings and recorded guidance. His policies of secrecy shaped Wakanda's vibranium doctrine. While foundational, many of his decisions complicate modern conflicts over vibranium use. He is T'Challa's father, and he has a mutant version of the Purple Heart mixture, giving him super strength, wisdom, and kinetic abilities.

14. Bashenga

Bashenga was Wakanda's founder and first protector. His legacy defines how vibranium was originally regulated and revered. His strict philosophy clashes with modern ambitions to expand vibranium use. Bashenga is Azari's father, and uses a different kind of Foresight, which allows him to predict any immediate threat to him, which has kept him alive for centuries.

15. Namor

Namor, ruler of Talokan, views Wakanda's vibranium mining as a global threat. He possesses superhuman strength, flight, and aquatic mastery. While capable of cooperation, his pride and territorial instincts make diplomacy volatile.

16. Queen Divine Justice (Chanté)

A distant royal descendant, Chanté believes vibranium belongs to all Wakandan bloodlines. She manipulates public opinion and political structures rather than using force. Her lack of military power leaves her exposed if challenged directly. She has numerous connections, and is one of the most politically influential people in Wakanda.

17. Azari

Azari is a philosopher, who believes in flexibility when it comes to vibranium usage. His ability is Foresight, which allows him to write poems dictating vague details about the future. This ability is uncontrollable, but he has much potential.

18. M'Kathu

M'Kathu is a rogue vibranium miner using unstable, self-made tools. His weapons are destructive but unpredictable. These weapons include amplified digging tools and shockwave amplifiers. He is as much a danger to himself as to others.

19. N'Yami

N'Yami is a Wakandan scientist advocating for a future without vibranium dependence. She develops alternative energy systems to rival vibranium tech. Her idealism limits her influence during crises. Her key technology is the Biosystem, a parasitic environment which can produce Xenergy, a vibranium substitute in the works.

20. Tetu

Tetu is a radical environmentalist who believes vibranium mining is destroying Wakanda's natural balance. He uses bio-engineered plant weapons to sabotage mining operations. His methods are effective but indiscriminate. Tetu is closely allied with N'Yami, so he has access to some of her weapons and has connections with radicals all over the country.
